

# *Café Scientifique Orlando*

## Upcoming talks

### ***November 2, Periodic Table***

A discussion and fresh look at the amazingly elegant tabular layout of the chemical elements. In 1869, Dmitri Ivanovich Mendeleev constructed the most successful table. He arranged elements by properties, and left holes where nothing had yet been discovered, predicting what future discoveries would find. It's still one of the more elegant descriptions of what makes up our universe.

*Every month, we drag a scientist out of the lab, down to the pub, and talk about some neat topic. It's free. It's fun. You're invited.*

### ***December 7, Practical Starship Engineering***

Traveling to the next starsystem is an enormous undertaking. The social and engineering problems that are still unsolved stretch credulity and imagination. DARPA (the org that started the Internet) seeded a study including hundreds of scientists, authors, sociologists, and other thinkers to work out the practical details. We'll hear a report from their first conference.

### ***January 4, Bones Underfoot***

Archeologist talks about ancient human remains in Florida.

First Wednesday, monthly. 7pm. Taste Restaurant, College Park. 717 W Smith St, Orlando, 32804
